

Winding Tree

Current technical state of hotel platform

2 min read · Jun 27, 2018

We have been working very hard on a distributed architecture that would support a hotel related part of our Winding Tree platform. And today, we are finally able to show you a piece of code that should demonstrate, how easy it can be to read data from it.

So without further ado, here it is:

```

1  const WTLibs = require('@windingtree/wt-js-libs');
2  const SwarmAdapter = require('@windingtree/off-chain-adapter-swarm');
3  const HttpAdapter = require('@windingtree/off-chain-adapter-http');
4
5  const libs = WTLibs.createInstance({
6    dataModelOptions: {
7      provider: 'https://ropsten.infura.io/',
8    },
9    offChainDataOptions: {
10     adapters: {
11       'bzz-raw': {
12         options: {
13           swarmProviderUrl: 'https://swarm-gateways.net/',
14         },
15         create: (options) => {
16           return new SwarmAdapter(options);
17         },
18       },
19       https: {
20         create: () => {
21           return new HttpAdapter();
22         },
23       },
24     },
25   },
26 });
27
28 (async () => {
29   const index = await libs.getWTIndex('0x407f550023eb6ad8a4797844489e17c5ced17e06');
30   const hotels = await index.getAllHotels();
31   console.log('Checking an actual Winding Tree Index on Ropsten - 0x407f550023eb6ad8a4797844489e17c5ced17e06');
32
33   console.log('=' .repeat(80));
34   console.log('Checking out hotel with data on HTTPS')
35   console.log('hotel address: ' + await hotels[0].address);
36   const hotel1dataIndex = (await hotels[0].dataIndex);
37   console.log('off-chain data location: ' + await hotel1dataIndex.ref);
38   const hotel1descriptionData = await hotel1dataIndex.contents.descriptionUri;
39   console.log('off-chain description data location: ' + await hotel1descriptionData.ref);
40   console.log('off-chain stored hotel name: ' + await hotel1descriptionData.contents.name);
41   console.log('-' .repeat(80));
42
43   console.log('Checking out hotel with data on Swarm')
44   console.log('hotel address: ' + await hotels[1].address);
45   const hotel2dataIndex = (await hotels[1].dataIndex);
46   console.log('off-chain data location: ' + await hotel2dataIndex.ref);
47   const hotel2descriptionData = await hotel2dataIndex.contents.descriptionUri;
48   console.log('off-chain description data location: ' + await hotel2descriptionData.ref);
49   console.log('off-chain stored hotel name: ' + await hotel2descriptionData.contents.name);
50 })();

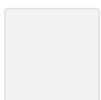

```

In these 50 lines of code, we are configuring an instance of [wt-js-lib](#)s and accessing a demo Winding Tree Index on Ethereum's Ropsten testnet and then downloading descriptive JSON data about two hotels from two different storages — [HTTPS](#) and [Swarm](#).

There's of course a lot of code under the hood, but our goal is to provide tools that will significantly lower the necessary level of knowledge required to use our platform. So this is only a first version and a first level of abstraction. We are also building a REST API that wraps all of our platform in a communication protocol familiar to millions of developers.

“But how do I put the data there?” I can hear you ask. That's actually much more complicated than just reading the data, and we are still figuring out how to make it so easy that everyone would instantly love it.

The code of this simple demo is on my [GitHub](#) and I plan to update it from time to time to showcase our progress. If you are interested in a broader picture, check out our [GitHub project](#) for the nearest release. For any technical questions or feedback, you are also welcome in our [Google Group](#)!
