1. We made a few changes to [wt-booking-api](#), its [#10](#) and the following patches. This sample implementation will allow you to send email confirmations to both the customer and the hotels. So if you want to book a room in our test [Mazurka Hotel](#), you would see the confirmation in [its public inbox](#). The customer confirmations are turned off to prevent them from being spammed. Please be aware that the inbox is completely public and visible to anyone that looks at it, any data you add there can be seen by anyone that looks at it.

2. We unified all of the dockers images for the hotel explorer. The idea here is that this will make it easier to deploy the app in other environments. It will allow us to make the docker images publicly available and easy to use.
3. This is why we have the setup a public docker image repositories on dockerhub. We don't have a ton in there for the time being, but we will start to gradually release all of our API's and apps there so that anyone can start testing out the platform.
4. We are still working out how to do the best model of data validation in wt-read-api. The reasons for this is because we will eventually need to support multiple version of the data through a single API.

Thank you for your continued support and patience! If you have any questions, join our Telegram, any technical discussion should go to our Google Group. If you want to contribute, a good place to start is our GitHub.
