Weekly Development Update 4/15 to 4/28

Due to the Easter Holiday last week we didn't have an update. But we are back this week with what we believe to be some interesting updates.

We are pushing forward with this [system against spam](#), please read that post to get yourself familiar with our easily extensible design. We are still working on ironing out details so things may change here and there.

As part of this, we did a decent and unfortunately backward incompatible, [refactoring](#) of the Javascript library

To kick things off with the spam protection, we developed a very simple clue based on a Curated list smart-contract, the idea is that the owner of the list let's say Winding Tree, is providing a guarantee for the listed addresses. So if your address is on the list, people should trust you. The smart contract is wrapped into a thin JS wrapper that can be further used in our JS library like this:

```
import { WtJsLibs } from '@windingtree/wt-js-lib';
import InMemoryAdapter from '@windingtree/off-chain-adapter-in-memory';
import CuratedListTrustClue from '@windingtree/trust-clue-curated-list';

const libs = WtJsLibs.createInstance({
  onChainDataOptions: {
    provider: 'http://localhost:8545',
  },
  offChainDataOptions: {
    adapters: {
      // This is how you plug-in any off-chain data adapter you want.
      'in-memory': {
        options: {
          // some: options
        }
        create: (options) => {
          return new InMemoryAdapter(options);
        },
      },
    },
  },
  trustClueOptions: {
    clues: {
      'curated-list': {
        options: {
          provider: web3ProviderAddress,
          address: '0x...',
        },
        create: async (options) => {
          return new CuratedListTrustClue(options);
        },
      },
    },
  },
});
```

And this can then be used for example in the Read API like this:

```
async function passesTrustworthinessTest (address) {  
  const wtLibsInstance = getInstance();  
  const trustClueClient = wtLibsInstance.getTrustClueClient();  
  const trustworthinessTestResults = await  
  trustClueClient.interpretAllValues(address);  
  return trustworthinessTestResults  
    .map((v) => v.value === true)  
    .indexOf(false) === -1;  
}
```

The idea is that everyone who's running any piece of software talking to the Winding Tree platform will be able to use any combination of these clues to determine a trust level towards an Ethereum address. These will be coming either in a booking request or can be part of the hotel/airline data so anyone can decide which data they want to consume.

In a similar way to the Curated List, we are slowly starting to work on the Lif staking or deposit trust clue.

Do you have something to add or would you like to ask about more details? Join our [Telegram](#), any technical discussion should go to our [Google Group](#). If you want to contribute, a good place to start is our [GitHub](#) and [Developer Portal](#).

Don't forget that we are doing our second hackathon this July in Lisbon. You can learn more about it [here](#).
