WINDING TREE

Third time's the charm and Winding Tree Hackathon was no difference! As part of the [World Travel Market](#) in London, United Kingdom, we ran our latest edition of #HackTravel with some exciting results.

As we kind of rushed this event, our participant list was a little shorter than the last time and we ended up with three submissions taking on very different parts of our platform.

Winding Tree Auth

Winding Tree Auth team worked on a really interesting type of user identification based on movement. Supposedly, everyone's walking pattern is slightly different, so you can use this pattern as a unique identifier like you would use fingerprints.

By collecting the data from mobile phone sensors they are able to come up with patterns that are different for every person and thus they can match the current holder of the phone against its rightful owner's walking pattern.

And what's the relation to Winding Tree? This kind of user identification can be used either as a seed of your Ethereum wallet or as a confirmation pattern for transactions. You would be able to confirm changes to your ORG.ID just by walking around. How cool is that?

ORGID.NET Library

This one is not the flashiest type of project, but a very useful one. We already have a Javascript library, and the team created a similar wrapper for our smart contracts in .NET. This is very useful for others who would like to start to incorporate ORG.ID in their projects and lowers the entry bar significantly.

A second part of the project was a little onboarding console app that registered an ORG.ID for you. A great example of how you can validate that the library is actually doing its thing.

As this was the first experience with Ethereum for the team, they had to overcome a lot for the first-time during the hackathon. But if I compare it to our first Prague Hackathon experience, these first encounters are getting easier and easier for the newcomers.

Booking Engine

We also had a few familiar faces from Siesta Cloud taking part in the third hackathon edition and they worked on a distributed booking engine.

Part of their solution was also a basic check of ORG.ID transactional history on Ethereum to establish a credibility of the business. In addition to all of this, they also published the app on IPFS and registered an ENS name for it, taking inspiration from our valued guest, Makoto Inoue, who gave a talk over viewing these two technologies.

In the end, the guys finished all the way through and demonstrated a booking that was paid for in ETH by using Metamask. This is a significant step forward in making an easily usable solution for the masses.

. . .

And this is it! Thanks again to our friends organizing the WTM, thanks to Makoto for stopping by and most importantly, thanks to all the hackers who joined us. We hope to see you next time!
