FEBRUARY UPDATE 2023

PROTOCOL & PARTNERSHIPS

At Winding Tree, we're excited to share with you our progress from the past month. We've been hard at work improving our protocol and forging new partnerships to revolutionize the travel industry. Here are some highlights of what we've been up to:

Protocol overview and update

Let's all remember one more time about the vision and mission of the Winding Tree protocol.

The WindingTree market protocol is a decentralized platform that connects travelers directly with service providers, such as airlines, hotels, and tour operators, without intermediaries.

The protocol leverages blockchain technology to create a transparent and secure marketplace that reduces costs for consumers and increases profits for service providers. We summarized for you what the protocol includes and what developments we made in February. Please keep reading ^^

L3 network:

It is expected that L3 network will provide a lot of improvements to different areas of the blockchain performance and offers opportunities such as scaling, customization, and security.

A customizable and trustless EVM-compatible blockchain that is expected to provide 10–100X performance increase compared to known L2 solutions. That's HUGE, right?!

We are planning to use the LIF token in this network which will open its potential and expand the range of use cases.

Coordination server:

The coordination server is a centralized pub-sub server that facilitates dynamic communication between buyers and suppliers. Buyers can broadcast requests, and suppliers can generate verifiable offers and transfer them to buyers. Using this server buyers are able to broadcast requests and suppliers can catch these requests on the basis of contextual subscriptions.

In the response to these requests, suppliers generate deal offers and its turn transfer them to buyers.

Protocol clients:

These are the clients of the coordination server that can be started in the browser or mobile environment, and equipped with the tools for creating, validating, and publishing requests.

Supplier nodes:

Supplier nodes are the ones that catch incoming requests, build signed offers, and connect external resources such as databases or content provider APIs.

Smart contract:

The decentralized component of the protocol is used by parties for the finalization of deals and funds management. It includes modules for suppliers registry, deals registry, deal funds management, and LIF deposits management.

In the future, it's expected that the protocol's native token LIF will be managed by a DAO that collects fees from transactions and invests in infrastructure projects. The DAO also validates the protocol's L3 network and approves protocol changes via voting.

In conclusion, the WindingTree market protocol has the potential to revolutionize the way people plan and book their travel arrangements by disrupting the traditional travel industry and eliminating intermediaries.

Partnerships

We already mentioned the tremendous benefits and opportunities of the L3 network. We didn't want to miss this opportunity and as we said earlier, we plan to use the LIF as a native token in this network. In this mission, we are partnering up with the ZKsync team, which is one of the leading providers of Ethereum scalability solutions, to integrate the HyperChain solution as an L3 protocol. We plan to do it in Q3 2023. More updates are coming soon! Stay tuned 🚀

Last but not least, we started working on technical specifications and documentation and we will be giving more updates in the coming month.

Thank you for your continued support and dedication to Winding Tree's development. We're grateful to everyone who has contributed to our success so far and we hope to continue delivering exciting updates to our community!

Sign up for our newsletter for more updates in the coming months 🎉

With love, *Winding Tree team!*
