## MAY UPDATE 2023

### SMART CONTRACT PROGRESS AND SDK REFACTORING

In our latest development update for May, we are excited to share significant progress in the advancement of our protocol. Throughout the month, our

focus was primarily on the smart contract and the software development kit (SDK). We successfully implemented all primary functions of the smart contract, and we made notable changes to the SDK framework. In this blog post, we will provide a detailed overview of the achieved milestones and our plans for June.

### Smart Contract Development:

Our development team dedicated considerable effort to the implementation of the smart contract functionalities. We are thrilled to announce that all key features of the protocol have been successfully integrated into the contract. These include:

1. **Protocol configuration:** The contract now encompasses the necessary parameters to configure the protocol effectively.
2. **Participant identity management:** We have implemented a robust system for registering and managing participant identities within the protocol.
3. **Deal creation and management:** The smart contract facilitates various deal operations such as canceling, transferring, check-in, and check-out.
4. **Protocol workflow hooks:** We have added workflow hooks that will play a vital role in integrating tokenomics functions into the protocol.

To ensure the reliability and stability of the smart contract, extensive unit tests have been conducted. The test version of the contract is currently deployed on the Polygon zkEVM Testnet. You can access the contract addresses in our repository at the following link: [GitHub Repository](#).

### SDK Refactoring:

While significant progress has been made in the SDK implementation, we encountered technological requirements that necessitated a change in the basic framework. As a result, we made the decision to shift from using

ethers.js to viem for the SDK's basic framework and blockchain interaction library.

Although this change required refactoring of the previously developed code, we are confident that it will enhance the overall performance and functionality of the SDK. To implement this change effectively, we have created a [pull request](#) (PR) request, which is currently under review and pending merge. We anticipate completing the SDK refactoring in the upcoming days.

### Future Plans:

Looking ahead to June, we have outlined our priorities for the next phase of development. These include:

1. **Functional development of the protocol node:** We will be focusing on enhancing the functional part of the protocol node, ensuring its seamless integration within the ecosystem.
2. **Refining SDK usage examples:** To provide users with a better understanding of our SDK, we plan to refine and expand the usage examples, making it easier for developers to adopt and implement the protocol.
3. **Unit tests and stability:** Ensuring the stability and reliability of the protocol is of utmost importance to us. We will be conducting comprehensive unit tests to identify and rectify any potential issues, further solidifying the protocol's performance.

May has been an exciting month for the development of our protocol. We have achieved significant milestones in the implementation of the smart contract, while also undergoing necessary changes in the SDK framework. We appreciate your continued support and enthusiasm as we work towards refining and optimizing our protocol. Stay tuned for more updates in the

coming months as we continue to make strides towards building a robust and efficient ecosystem.
