In the closing month of 2023, a significant milestone was achieved with the commencement of full-fledged MVP development using the WindingTree Market Protocol SDK. This strategic move aims to showcase the protocol's real-world applicability in a practical business scenario.

The focus of this development effort is a user-friendly booking application tailored for tourist flights on small aviation aircraft. The initial phase is set to establish connections with 1–2 airports within the European zone. The primary objective of this application is to enhance both user and developer experiences within the framework of the protocol.

From an architectural standpoint, the MVP comprises several integral components:

1. **Protocol Smart Contracts:** These form the backbone of the system, facilitating secure and transparent interactions within the protocol.
2. **Coordination Server:** Responsible for ensuring seamless communication and coordination among various components, contributing to the smooth operation of the entire system.
3. **Service Provider's Server Node:** An essential element that hosts and manages the services related to tourist flight bookings.
4. **Web Application for Server Node Management:** A user-friendly interface for developers to configure, manage states, handle service database functions, and perform reception tasks such as check-in and checkout refunds.
5. **Booking System Web Application:** This component facilitates service search and booking functionalities, ensuring a comprehensive and intuitive user experience.

As of now, the first three components within the MVP have been fully implemented, showcasing the robust foundation laid by the WindingTree Market Protocol SDK. The server node management web application is halfway through its implementation, with an anticipated first test version scheduled for release in February 2024.

This phased approach ensures a systematic and thorough development process, allowing for careful testing and refinement of each component before the full application launch. The commitment to delivering a reliable and user-friendly product is evident in the steady progress and careful attention to detail demonstrated throughout the development journey.

The upcoming release of the test version in February 2024 holds promise for stakeholders eager to witness the practical outcomes of the Winding Tree Market Protocol SDK in action. This milestone not only signifies progress in the realm of flight bookings but also serves as a testament to the protocol's adaptability and effectiveness in real-world scenarios. As the development journey continues, the collaboration between the components within the

MVP is set to deliver an integrated and seamless solution for users and developers alike.
